"Concerning the Question of Reduction of the Directive Gain of an Antenna
During Reception of a Fluctuating Signal"

Moscow, Radiotekhnika i Elektronika, Vol 17, No 9, Sep 72, pp 1816-1822

Abstract: The problem of variation in the directive gain of a large linear antenna during reception of a fluctuating signal is considered. It is shown that directive gain depends on the ratio between the powers of the "mirror reflection" and scattered components of the signal, and may differ considerably from the theoretical value. If there is no mirror image component of the signal, then the directive gain of the antenna is determined by the ratio of the correlation radius of the field to the wavelength, and does not change with an increase in the length of the antenna.

"The Relative Radiation Sensitivity of Some Animal Organs"

Leningrad, Vestnik Leningradskogo Universiteta, Biologiya, No 2, 1973,
pp 88-94

Abstract: At the peak of radiation sickness (72 hrs after irradiation of rats and rabbits with a lethal dose of X-rays amounting to 1,000-1,200 and 3,000 R, respectively), changes in the proteins, nucleic acids, and lipids of the animals' small intestine, liver, spleen, brain, and skeletal muscles were studied. On the basis of changes established by the investigation of organ and tissue homogenates, the small intestine, spleen, and liver must be regarded as radiation-sensitive, while the brain and skeletal muscles are radiation-resistant. The results obtained for mitochondria isolated from the organs of the animals agreed with those obtained in the study of homogenates derived from the organs in question. The conclusions reached in regard to the relative radiation sensitivity of the organs and tissues studied are in agreement with those arrived at by other investigators, except in the case of the liver, which is regarded as radiation-resistant in some published work. According to the data obtained in the present work, the biosynthesis of total lipids in the liver of rats decreased by 32%, while that of cholesterol increased by a factor 1/2

USSR

MAKHLINA, A. M., et al., Vestnik Leningradskogo Universiteta, Biologiya, No 2, 1973, pp 88-94

of three. The content of lipids + cholesterol increased by 11-12%. The biosynthesis of total lipids and proteins in the mitochondria of the rat liver increased significantly, while a change in the content of these two components did not take place. The biosynthesis of lipids and proteins was studied by means of a tracer introduced by the addition of radioactive Na acetate ($2^{14}C$). The results of the work described indicated that the radiation sensitivity increased with increasing intensity of the metabolic activity of the organs and tissues.

"Intensity of Lipid Metabolism and Complexes of Lipoids With Proteins in the Mitochondria of the Small Intestines of Irradiated Animals"

Nauch. dokl. vyssh. shkoly. Biol. n. (Scientific Reports of Schools of Higher Education. Biological Sciences), 1971, No 7, pp 59-62 (from RZh-Biologicheskaya Khimiya, No 23, Dec 71, Abstract No 23F1682)

Abstract: The intensity of restoration of lipids and their complexes with proteins changes significantly in the mitochondria of the small intestines of rats 48 hours after 800 roentgens of x-irradiation. The radioactivity of the entire suspension of mitochondria and protein complexes in the irradiated animals drops. Separate determination of the radioactivity of the proteins and lipids of these complexes demonstrated that 2-C¹⁴-acetate is included both in the lipid and the protein part of the lipoprotein molecule. Normally, more than half of all the activity of the lipoproteins goes to radioactivity of the lipids; under the

1971, No 7, pp 59-62

conditions of radiation injury of the animals, a large part of
the radioactivity goes to the protein. This is connected with
significant inhibition of the biosynthesis of lipids in the
mitochondria of irradiated rats.

"Optical Characteristics of p-Type $Pb_{1-x}Mn_xTe$ Solid Solutions"

Leningrad, Fizika i tekhnika poluprovodnikov, No 8, 1972, pp 1478-1482

Abstract: The work described by this paper is the investigation of infrared reflection and absorption spectra in solid solutions of $Pb_{1-x}Mn_xTe$, with the purpose of explaining the energy structure of these alloys. The reflection spectra were measured with specimens having various carrier concentrations and with an Mn concentration of up to 9% at 300° K, and such spectra are plotted for alloys in which $x = 0.03, 0.06, 0.09$ with identical Hall concentrations. The absorption spectra were obtained for polycrystalline specimens of $Pb_{0.95}Mn_{0.05}Te$ and $Pb_{0.9}Mn_{0.1}Te$ and are reproduced as well. It is found that the introduction of Mn into $Pb_{1-x}Mn_xTe$ alloys leads to a change in the respective positions of light and heavy hole zones, and that the structure of the alloys' valent zones differs substantially from those of PbTe.

"Application of a Metallographic Method for Determination of the Depth of
Surface Hardening in Nickel-Chromium Based Alloys"

Moscow, Zavodskaya Laboratoriya, No 11, 1972, pp 1359-1360.

Abstract: The influence of the chemical composition of alloys on the possibil-
ity of metallographic determination of strain hardening by decoration of dis-
locations with the carbide phase liberated upon aging is studied. The method
can be used for nickel-chromium alloys of any composition with carbon contents
of at least 0.05%. Hardening 20-30 μ up to several millimeters in depth is
revealed.

"Independence of an Emotionally Induced Increase in Muscle Work Capacity From
the Blood Flow Through Working Muscles"

Leningrad, Fiziologicheskii Zhurnal SSSR imeni I. M. Sechenov, Vol 59, No 5,
1973, pp 781-788

Abstract: Measurements were made on young human subjects instructed to compress
the handle of a fist dynamometer for as long as possible while performing mental
calculations of mathematical problems presented at 3-sec intervals, with the
time allowed for each problem indicated by light flashes and the beat of a metro-
nome. The results revealed that emotional excitation increases the endurance
of working muscles by about 50% on the average and accelerates blood flow
through resting muscles (plethysmographic measurement). However, there is
no increase in blood flow through the working muscles when the force of con-
traction is 60% of the maximum force that can be generated voluntarily.
Similarly, the endurance of working muscles is increased by 40% and 30%
1/2

respectively when the effort is only 30% of the maximum but an increase in blood flow is prevented by partial occlusion of the brachial artery or the flow is arrested by complete occlusion of that vessel. The emotionally induced cholinergic discharge by the sympathetic system not only causes vasodilation in resting muscles but also stimulates glycolysis, production of lactic acid, and activation of phosphorylase. It is therefore concluded that the emotionally induced increase in muscle capacity to do static work is due to an augmented anaerobic metabolism in muscle tissue and is independent of the blood flow prevailing in the working muscles.

"Some Problems of Memory and the Role of the Limbic System in the Registration
of Information"

Moscow, Zhurnal Vysshey Nervnoy Deyatel'nosti imeni I. P. Pavlov, Vol 23, No 2,
Mar/Apr 73, pp 305-314

Abstract: According to current evidence, memory is stored and analyzed at corresponding levels of increasing complexity. However, while storage of memory traces is dispersed, processes involving selection of information for storage are controlled by the well-delineated limbic system. Within it, the most important role is played by hippocampal field CA₃ which functions as a comparing mechanism matching current with trace excitations. In this field the strongest reaction occurs to the first stimulus, and in field CA₁, to the second stimulus. In the mammillary bodies reactions are generated after 3-4, in the anteroventral nucleus after 4-7, and in the cingulate cortex (the highest level) after 8-15 stimulations. It is apparent that each successive link in the information portation of the limbic system functions as an integrator of recurrent stimuli, which processes the impulses and dispatches a signal to the next higher structure only after a critical level of excitation is reached. Reactions in field

Vol 23, No 2, Mar/Apr 73, pp 305-314

CA₃ become extinct when responses are generated in the limbic cortex. The limbic system may be regarded as an integrated functional system of information registration in which each structure performs a definite but relatively simple operation.

Neyronnyye Mekhanizmy Oriyentirovochnogo Refleksa (Neuronal Mechanisms of the Orientation Reflex), Moscow, Moscow University Publishing House, 1970, 432 pp

Translation; Introduction: Polygraphic recording of somatic, vegetative, and electroencephalographic reactions of animals and man made it possible by means of repeated stimuli of different modes and intensities to differentiate between adaptation, defense, and orientation reflexes. The adaptation reflex, which in part is a protective reflex, is characterized by a relatively high threshold, specific type of reaction local reflexogenic zone, different direction of changes when engaging and disengaging the stimulus, and high stability when stimulation is repeated. The defense reflex as the protective reflex of the entire organism differs from the adaptation reflex by its wide generalized reaction, a higher threshold, and a capacity to be induced by stimuli of different modality.. The orientation reflex is characterized by a low threshold of formation, wide generalization of stimulation, an absence of a specific reflexogenic zone, monotype reactions in engaging and disengaging the stimulus, and also the development of extinction which is selective with relation to the parameters of the repeatedly applied stimulus.

In order to explain the extinction signal specific with relation to the parameters of the orientation reflex the concept of a "nervous model of the stimulus" -- the path of fixation of the properties of the applied stimulus

1/7

USSR

SO KOLOV, YE. B., and VINOGRADOVA, O. S., Neyronnyye Mekhanizmy Oriyentirovochnogo Refleksa, Moscow, Moscow University Publishing House, 1970, 432 pp

was introduced. The orientation reaction is regarded as being the result of the formation of a signal of disagreement induced by the disagreement between the external signal and the nervous model of the stimulus. Within certain bounds, the greater the difference between the afore mentioned nervous model of the stimulus and the parameters of the tangible active stimulus, the stronger the orientation reaction (Ye. N. Sokolov, 1960).

If the repeating signal is characterized by a number of stable properties such as color, intensity, and spatial localization, then the nervous model of the stimulus fixes all of the parameters simultaneously. The intensity of the orientation reaction increases in proportion to the simultaneously modified parameters of the signal.

Not only elementary but also complex criteria of the signal, such as coincidence or the succession of several stimuli in time, are imprinted in the nervous model of the stimulus. This is proven by the development to differentiate between the extinction signal selective with relation to the parameters of the reactions not directly linked with changes in the functional state, and that in an overall change of the functional state which can disturb selective extinction attained in an active state.

2/7

USSR

SOKOLOV, YE. S., and VINOGRADOVA, Neyronnyye Mekhanizmy Oriyentirovochnogo Refleksa, Moscow, Moscow University Publishing House, 1970, 432 pp

However, the study of macroreactions does not make it possible to expose the internal mechanisms of the orientation reflex. In this connection an investigation of reactions of separate neurons by methods used in analogous studies of manifestations of the orientation reflex at the level of macroreactions was undertaken.

The investigation was conducted on nonanesthetized rabbits by means of extracellular microelectrode recording. Specific (retina, anterior corpus bigeminus, corpus geniculatum laterale, and the visual cortex of the cerebral hemispheres) and nonspecific (hippocampus, reticular formation of the mesencephalon, and nonspecific nuclei of the thalamus) systems were investigated.

The electrical potentials after their reinforcement were separated by a system of two filters. The first filter separating signals in the 0.5-100 Hz range made it possible to record the slow component of the bio-currents. The second filter by separating signals within the 300-500 Hz range made it possible to record commissure activity. The main method used in the investigation of the neuronal organization of the orientation reflex was the multiple application of the stimulus at constant intervals, thereby making possible the determination of the reaction stability of the neuron being studied. If the course of the experiment an extinction reaction developed, then the selectivity extent of the attained extinction was studied by the assembly of test-stimuli.

"Synthesis of Manganese Polydibutylphosphinate"

Moscow, Vysokomolekulyarnyye Soyedineniya, Vol 15, No 3, Mar 73, pp 516-520

Abstract: Manganese polydibutylphosphinate has been synthesized by oxidative decarbonylation of manganese carbonyl with dibutylphosphinic acid under UV irradiation, and by polycondensation of dibutylphosphinic acid with manganese and manganic acetates. The effect of the type of solvent used, the temperature and duration of the reaction, as well as the effect of concentration and relationship of starting materials on the polycoordination process of dibutylphosphinic acid and manganese acetate has been investigated. The process of the polycondensation of manganese acetate with dibutylphosphinic acid is an equilibrium process.

"Reactions of 1,2-Dihydroquinolines. III. Addition of Benzene and Phenyl Halides to the Double Bond of 2,2,4-Trimethyl-1,2-dihydroquinolines"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 6, Jun 71, pp 795-797

Abstract: 2,2,4-Trimethyl-1,2-dihydroquinoline (I) does not react with benzene at room temperature, even with excess $AlCl_3$. When heated it yields products of di- and polymerization. On the other hand the hydrochloride or N-acetyl derivative of (I) adds benzene at room temperature. When $AlCl_3$ is replaced by iron or zinc chloride or by strong mineral acids, the reaction does not take place at all. Solvents which are capable of forming stable complexes with $AlCl_3$ -- such as diethyl ether, nitromethane, dibutyl ether, or nitrobenzene -- hinder the reaction. Substituting a benzyl group in position 1 or a methyl group into the aryl ring has practically no effect on the reaction, while the presence of a methoxy group in position 6 hinders the process considerably. Hence, addition of benzene to (I) requires a preliminary protonation or acylation of the amino group. Phenyl halides react under drastic conditions yielding only para-substituted 4-aryl-2,2,4-trimethyl-1,2,3,4-tetrahydroquinolines.

"What Is New in Polycondensation Methods for the Synthesis of Thermostable Polymers"

Moscow, Uspekhi Khimii, Vol 39, No 4, 1970, pp 679-701

Abstract: The article considers techniques for the synthesis of "heat-stable" and "thermostable" polymers by the method of nonequilibrium polycondensation. Heat stability is defined as "the maximum temperature at which a polymer is capable of retaining a specific mechanical strength," thermostability as "the maximum temperature which a polymer can withstand without chemical change, primarily without decomposition." There is a discussion of the synthesis of heat-stable polyarylates by the interaction of dicarboxylic acid chlorides with bisphenols and of the work done in this area by the Institute of Organoelemental Compounds, Academy of Sciences USSR, in conjunction with the Laboratory for the Kinetics of Polymerization Processes of the Institute of Chem-

THE INTRINSIC VISCOSITIES OF I AND II WERE MEASURED IN TETRAHYDROFURAN (III) AND CHCL SUB3 AT 20 PLUS OR MINUS 0.1 DEGREES, WHEREAS THE MOL. WTS. WERE MEASURED BY LIGHT DIFFRACTION IN A VISUAL NEPHELOMETER AT LAMBDA EQUALS 5461 A. CALCN. OF MARK HOUWINK PARAMETERS (ALPHA AND K FOR I AND II IN III WERE 1.14 AND 3.24 TIMES 10 PRIME NEGATIVE6, AND 0.80 AND 1.55 TIMES 10 PRIME NEGATIVE5, RESP.) SHOWED THAT ALPHA WAS PROPORTIONAL TO THE LENGTH OF THE ALIPHATIC CHAIN, WHICH WAS INCONSISTENT WITH DATA OBTAINED FROM POLYARYLATES HAVING AROMATIC SIDE GROUPS. THE CHANGE IN THE HYDRODYNAMIC BEHAVIOR WAS ATTRIBUTED TO HIGHER CHAIN RIGIDITY.

79596s Degradation of aromatic polyimides at high temperatures. Gribkova, P. N.; Rode, V. V.; Vygodskii, Ya. S.; Vinogradova, S. V.; Korshak, V. V. (Inst. Elementoorg. Soedin. Moscow, USSR). *Vysokomol. Soedin., Ser. A* 1970, 12(1), 220-8 (Russ). The thermal degradation in vacuo, O₂ and air of aromatic polyimides (I) at 375-600° was investigated. I were prepd. by polycondensation of pyromellitic anhydride with 3,3-bis(p-aminophenyl)phthalide or 9,9-bis(p-aminophenyl)fluorene (II) and from 3,3',4,4'-tetracarboxydiphenyl ether and II. I were stable in vacuo at 425-75° but began to decomp. at higher temps. to yield solid and liq. low-mol.-wt. substances, as well as CO, CO₂, and H₂. Decompn. began via homolytic cleavage of the imide rings and isomerization. O₂ did not initiate the degradation but oxidized the cleavage product to accelerate the degradation of I. The presence on the central C atom of the starting diamine of a closed, cyclic group capable of conjugation increased the thermal stability of I.

"Structure and Properties of Polymeric Semiconductors Based on Pyrromallitic Acid Tetranitrile and p-Phenylenediamine"

Moscow, Vysokomolekulyarnyye Soyedineniya, Vol 14, Series A, No 3, 1972, pp 701-705

Abstract: The heating of a polymer based on pyrromallitic acid tetranitrile and p-phenylenediamine (polyhexazocyclane PF) from 20 to 300, 400, 500, 600, 700, 800, and 900° at 5×10^{-3} torr, yielded polymers with specific resistance ρ_{spec} from 10^{13} to 5×10^{-1} ohm cm and activation energy of conductivity ΔE from 1.7 to 0.1 eV, depending on the heat treatment. The structure of the polymers was determined by X-ray diffraction analyses, nmr studies, and IR spectroscopy. At heat-treatment temperatures above 500°C the polymer undergoes degradation and cross-linking accompanied by the formation of bundles of aromatic layers consisting mainly of condensed aromatic compounds.

"Ditermamine; a new Bimolecular Alkaloid From *Thermopsis lanceolata*"
Tashkent, Khimiya Prirodnykh Soyedineniy, No 1, 1972, pp 87-92

Abstract: From the plant portion of *Thermopsis lanceolata*, a new bimolecular
alkaloid of the quinalizidine series was isolated, in addition to thermopsamine,
thermopsine, citizine, N-methylcitizine, pachycarpine and rhombifoline. On
the basis of NMR and mass-spectroscopic studies of this alkaloid and its
hydrogenated derivatives, plus the fact that on vacuum distillation it
yields thermopsine, this product was identified as Δ 5',6'-dehydro- \checkmark -
isolupanyl-5'-thermopsin-3.

"Dimethamine -- a New Bimolecular Alkaloid Isolated from Thermopsis Alterniflora"

Tashkent, Khimiya Prirodnikh Soyedineniy, No 2, 1972, pp 218-222

Abstract: A new alkaloid, dimethamine, was isolated from the Thermopsis alterniflora by column chromatography on silica gel. The melting point of the new alkaloid is 216-217° C, accompanied by decomposition. The alkaloid is optically active and yields crystalline dihydrochloride, dipicrate and diiodomethylate. The composition and the nature of salts indicates that this substance has bimolecular structure. On the basis of IR, NMR and mass spectrometric data the following structure is proposed for the new compound.

"Synthesis and Properties of η^5 -Cyclopentadienylirondicarbonyl- σ -ferrocenyl"
Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimi Cheskaya, No 7, Jul 72,
pp 1600-1604

Abstract: Reaction of diferrocenylmercury with cyclopentadienylirondicarbonyl
iodide yields η^5 -cyclopentadienylirondicarbonyl- σ -ferrocenyl (I) -- a
crystalline compound of orange color. In solid state it is stable in air,
dissolves easily in organic solvents, but the solutions are less stable. The
structure of (I) was proven by IR, PMR and NGR spectroscopy as well as by
reactions with HCl, bromine, and mercuric chloride. Reaction of (I) with
(C₆H₅)₃P takes place without rearrangement, evidently one CO group being
replaced by (C₆H₅)₃P.

"Synthesis of σ -Ferrocenyl and σ -Ferrocenoyl Derivatives of Iron and Tungsten Cyclopentadienylcarbonyls"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 12, Dec 73, pp 2796-2798

Abstract: Reaction of ferrocenyl lithium with π -cyclopentadienyliron-dicarbonyl bromide yields π -cyclopentadienyliron-dicarbonyl- σ -ferrocenyl (I). Ferrocenoyl chloride reacted with π -cyclopentadienyliron-dicarbonyl sodium gives π -cyclopentadienyliron-dicarbonyl- σ -ferrocenoyl. Respective tungsten derivatives were obtained in an analogous manner. Decarbonylation of the ferrocenyl-tungsten complex by heating yields cyclopentadienyl-tungstentricarbonyl- σ -ferrocenyl. The iron complex requires more drastic conditions and some decomposition takes place in this reaction.

ABSTRACT. A STUDY WAS MADE OF THE APPEARANCE OF 3,748 CASES OF PCL PULSATIONS AT THE IRKUTSK EARTH CURRENTS STATION DURING THE PERIOD 1 AUGUST 1957 THROUGH 31 DECEMBER 1967. HISTOGRAMS OF THE DIURNAL VARIATION OF PCL SHOW THAT IN THE MIDDLE LATITUDES THE PERIOD FROM 2200 TO 1400 HOURS IS FAVORABLE FOR THE APPEARANCE OF PCL. THE GREATEST NUMBER OF PCL OBSERVED SIMULTANEOUSLY OVER A LARGE AREA SHOULD OCCUR AT 1400-0600 UT. ANALYSIS OF PCL OBSERVATIONS BY THE NETWORK OF SOVIET STATIONS CONFIRMS THIS CONCLUSION. THE ANNUAL WAVE IS CHARACTERIZED BY MINIMA DURING SOLSTICE PERIODS AND MAXIMA AT THE EQUINOX; THE AMPLITUDE OF THE ANNUAL WAVE IS TWICE AS GREAT AS THE AMPLITUDE OF THE SEMIANNUAL WAVE. THE MOST FAVORABLE CONDITIONS FOR THE APPEARANCE OF PCL ARE OBSERVED IN THE YEARS BEFORE AND AFTER THE SOLAR ACTIVITY MINIMUM; IN THE YEARS OF THE MINIMUM (1964-1965) THE FREQUENCY OF APPEARANCE OF PCL PEARLS IS DECREASED BY 40-50 PERCENT, ALTHOUGH THE FREQUENCY OF PCL DURING THIS PERIOD IS FIVE OR SIX TIMES GREATER THAN THE FREQUENCY OF THEIR APPEARANCE DURING THE PHASE OF MAXIMUM SOLAR ACTIVITY. THUS, IN THE CYCLIC VARIATION OF THE FREQUENCY OF OCCURRENCE OF PCL THERE IS A DEEP DEPRESSION DURING YEARS OF HIGH SOLAR ACTIVITY AND A FLAT (PROLONGED) MAXIMUM BETWEEN THE YEARS OF MAXIMUM AND MINIMUM SOLAR ACTIVITY. FOR PCL PULSATIONS IONOSPHERIC TRANSPARENCY SHOULD INCREASE FROM THE MAXIMUM TO THE MINIMUM OF SOLAR ACTIVITY. IN PARTICULAR, IN THE E LAYER THE NUMBER OF FREE ELECTRONS INCREASES BY A FACTOR OF ABOUT 1.5-2.0 DURING THE PERIOD BETWEEN THE SUNSPOT MINIMUM AND MAXIMUM.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THERE IS A DIURNAL CHANGE IN THE MAIN AXIS OF THE POLARIZATION ELLIPSE FOR PCL PULSATIONS: CONSTRUCTION OF POLARIZATION ELLIPSES OF THE H VECTOR OF THE PCL FIELD FOR SOGRA AND IRKUTSK STATIONS REVEALED THAT THE DIRECTION OF THE MAIN AXIS OF THE POLARIZATION ELLIPSE CHANGES AT 0500-0800 (LOCAL SOLAR TIME). IN THE EVENING AND NIGHTTIME HOURS THE AXIS OF PCL POLARIZATION IS DIRECTED TO THE NE, EARLY IN THE MORNING; PRIMARILY TO THE N, AND DURING THE DAYTIME NNW. HOWEVER, UNTIL NOW THERE HAS BEEN EXPERIMENTAL DOCUMENTATION ONLY FOR A MORNING INTERVAL OF ROTATION OF THE SIGN OF THE ANGLE OF DEVIATION OF THE MAIN AXIS OF THE POLARIZATION ELLIPSE FROM THE MAGNETIC MERIDIAN, ALTHOUGH IT HAS BEEN POSTULATED THAT THIS ALSO OCCURS IN THE INTERVAL 1700-2000 HOURS. PCL PULSATIONS ARE SPORADIC AND THEIR APPEARANCE CANNOT BE PREDICTED, ALTHOUGH TIMES FAVORABLE FOR OBSERVATION ARE KNOWN. MOREOVER, THE PERIOD 1700-2000 IS THE MINIMUM ON THE CURVE OF DIURNAL DISTRIBUTION OF PCL OCCURRENCE. CAREFUL STUDY OF RECORDS REVEALED THAT AT ABOUT 1800 THERE IS A GRADUAL STABILIZATION OF DELTA PHI AND E SUBX -E SUBY; DELTA PHI EQUALS 180DEGREES IS TYPICAL, ALTHOUGH 140DEGREES LESS THAN OR EQUAL TO DELTA EPSILON LESS THAN OR EQUALS TO 230DEGREES IS ALSO OBSERVED. THE MEAN DIRECTION OF THE POLARIZATION AXIS WITH THE EASTWARD DIRECTION FORMS AN ANGLE MINUS 9DEGREES (AXIS DEFLECTED TO THE SOUTH). THE DIRECTION OF THE POLARIZATION AXIS AT DIFFERENT TIMES WAS: 1600-1630, PLUS 30DEGREES; 1630-1700, PLUS 36DEGREES; 1700-1730, PLUS 39DEGREES; 1750-1800, MINUS 10DEGREES; 1800-1815, MINUS 7DEGREES.

"The Level of Equicohesive Temperature of VM-1A Molybdenum Alloy Upon
Short-Term Testing in a Vacuum"

Kiev, Problemy Prochnosti, No 10, Oct 73, pp 51-55

Abstract: It is established that the equicohesive temperature of VM-1A alloy in a vacuum of $5 \cdot 10^{-4}$ or $5 \cdot 10^{-5}$ mm Hg is approximately 1250° C and increases both as a result of preliminary triple washing of the chamber with argon (to about 1450° C) and as a result of protection of the surface of specimens with a heat-resistant coating (to over 1500° C). The level of the equicohesive temperature of the alloy results from the rate of development of surface microscopic cracks which develop at points of separation of hard and brittle oxygen-containing phases on grain-boundary surfaces, which are enriched with residual oxygen during high-temperature testing.

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 11, 1973, pp 2577-2580

Abstract: A study was made of the effect of trimethylphosphite and tri(dimethylamino)phosphine on 1,2-diphenyl-4-benzalpyrazolidine-3,5-dione (I). The study was made using thermography and infrared spectroscopy. Trimethylphosphite interacts with 1,2-diphenyl-4-benzalpyrazolidine-3,5-dione via the bipolar ion stage with the formation of the methyl ether of the enol form of the dimethyl ester of 1,2-diphenylpyrazolidine-3-5-dione-4-benzylphosphonic acid. On interaction of tri(dimethylamino)phosphine with 1,2-diphenyl-4-benzalpyrazolidine-3,5-dione, a stable adduct (1:1) was obtained having the structure of the bipolar ion with the P-C bond.

With N-Acetyltrichloroacetaldimine"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 5, May 73,
pp 1112-1116

Abstract: Several products are obtained from the reaction of N-acetyltrichloroacetaldimine [ATD] with trimethyl phosphite, depending on the reaction conditions. When the reaction is carried out at -13° , two crystalline products are obtained: dimethyl ester of α -(N-acetyl)-amino- β , β -trichloroethylphosphonic acid (I), m. p. $150.5-151^{\circ}$, and the dimethyl ester of α -(N-acetyl)amino- β , β -dichlorovinylphosphonic acid (II), m.p. $98-99^{\circ}$. The same reaction carried out without cooling is exothermic, the temperature of the reaction mixture rising to $40-45^{\circ}$, and it yields the phosphonate (I) plus an addition product of 1 mole of trimethyl phosphite to 2 moles ATD. The melting point of this addition product is $153.5-154^{\circ}$. With cooling to -40° the reaction products are (I), (II), and an inseparable mixture of several liquid products.

"Structures of the Reaction Products of Some α, β -Unsaturated
Carbonyl Compounds With Trimethylphosphite and Tri(dimethylamino)-Phosphine"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 4, Apr 72,
pp 865-871

Abstract: Trimethylphosphite reacts with 1,3-diphenyl-5-benzalbarbituric acid at -14° yielding a 1:1 addition product with bipolar structure which isomerizes easily to a methyl ester of the enol form of α -(1,3-diphenylbarbituryl-5)-benzylphosphonic acid dimethyl ester (I). The latter forms when the reaction is carried out at room temperature. Hydrolysis of (I) yields an enol form of a dimethylester of α -(1,3-diphenylbarbituryl-5)-benzylphosphonic acid. Reaction of tri(dimethylamino)phosphine with 1,3-diphenyl-5-benzalbarbituric acid yields a 1:1 crystalline addition product with a bipolar ionic structure. Dipole moment values and UV spectral parameters of a series of bipolar ions obtained from tri(dimethylamino)phosphine are reported.

"Structure of the Reaction Products of Trimethyl Phosphite with Acetyl-
and Benzoyl-p-quinone"

Moscow, Doklady Akademii Nauk SSSR, Vol 201, No 1, Nov-Dec 1971, pp 91-94

Abstract: The reaction of some p-quinones with trialkyl phosphites and phosphines was studied. Benzoyl-p-quinone reacts with trimethyl phosphite in dry nitrogen to form dimethyl-p-methoxy-o-benzoyl phenylphosphate (I); ^{31}P nmr showed the presence of an unstable bipolar ion (II), the latter rearranged to (I). The results indicate the formation of (II) as an intermediate in the presence of 1 mole of acetic acid; the only product is dimethyl p-hydroxy-o-benzoyl-phenyl phosphate (III). The reaction of acetyl p-quinone with trimethyl phosphite at low temperatures produces a phosphorane which in methylene chloride rapidly isomerizes into an enol ether. Physical data, structural formulas, compositions and infrared spectra for these and several other compounds are given.

"Interaction of Trialkyl Phosphites with α, β -Unsaturated Acids"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 6, Jun 71,
 pp 1259-1266

Abstract: Experimental material indicates that the addition of trialkyl phosphites to α, β -unsaturated acids may proceed by preliminary protonation of the trialkyl phosphites by the unsaturated acids, with subsequent addition of the resultant dialkylphosphorous acids to esters of the unsaturated acids to give trialkyl esters of the corresponding β -phosphonocarboxylic acids, according to the scheme:

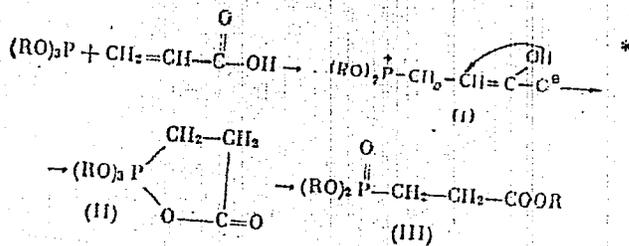

1/3

USSR

GAZIZOV, T. Kh., Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 6, Jun 71, pp 1259-1266

It is also possible that these reactions proceed according to the scheme suggested by V. A. KUKHTIN and G. Kh. KAMAY, viz.

but without the formation of an intermediate cyclic product of the phosphorane type. The reaction may proceed simultaneously according to both schemes.

The interaction of trimethyl phosphite with acrylic acid, along with trimethyl ester of β -phosphonopropionic acid, gives a small amount of the cyclic anhydride of methyl ester of β -phosphonopropionic acid. The latter is obtained in much greater quantities in the presence of acetic acid. The

"Spirophosphoranes Based on Acrolein and Methyl Esters of Ethylene-glycol-
and Butyleneglycol-1,3-phosphorous Acid"

Moscow, Doklady Akademii Nauk SSSR, Vol 205, No 4, Aug 72, pp 843-846

Abstract: The reaction of acrolein with cyclic phosphites was studied. Addition of acrolein to the methyl ester of ethyleneglycolphosphorous acid in absolute ether yielded 1,6,9-trioxa-[(5-methoxy)-5-phosphaspiro-(4,4)] 2-nonene, b.p. 55-56°/10⁻³mm, n_D²⁰ 1.4820, d₄²⁰ 1.3016. When butyleneglycol-phosphorous acid methyl ester was used, the product was 1,6,10-trioxa-9 methyl-[(5-methoxy)-5-phosphaspiro-(4,5)]-2-decene, b.p. 61-62°/10⁻³ mm, n_D²⁰ 1.4780, d₄²⁰ 1.2041. Addition of methyl vinyl ketone to the methyl ester of butyleneglycolphosphorous acid yielded, after a somewhat slower reaction, 1,6, 10-trioxa-2,9-dimethyl-[(5-methoxy)-5-phosphaspiro-(4,5)]2-decene, b.p. 73-74°/10⁻³ mm, n_D²⁰ 1.4745, d₄²⁰ 1.1707. The reactions were carried out with exclusion of moisture, under continuous stirring, keeping the temperature below +25°C. The products were found to hydrolyze easily in air but were stable enough to be distilled under high vacuum.

"The Reactions of 5-Benzalbarbituric Acid with Trimethyl Phosphite and
Tris(dimethylamino)phosphine"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 3, Mar 71,
pp 573-577

Abstract: At minus 14° trimethyl phosphite (I) added to 5-benzalbarbituric acid (II) with the formation of a 1:1 addition product (m.p. 80-5°) that had a bipolar structure. This product isomerized to the methyl ester of the enol form of the dimethyl ester of barbituryl-5-benzylphosphonic acid (III; m.p. 220-2°). The latter compound formed directly when the reaction was carried out at room temperature. On treatment of III with HCl, the dimethyl ester of barbituryl-5-benzylphosphonic acid (IV; m.p. 244°) was obtained. Dimethyl phosphite reacted with II to form a product which on recrystallization from dioxan yielded the dioxanate of the enol form of the dimethyl ester of barbituryl-5-benzylphosphonic acid (m.p. 154-5°). Treatment of the dioxanate with HCl resulted in the formation of a product that proved to be
1/2

identical with IV. In the presence of glacial acetic acid, I and II reacted with the formation of IV, which was isolated in the form of the enol dioxanate. The reaction of tri(dimethylamino)phosphine with II yielded a 1:1 addition product (m.p. 150-2°) which had the structure of a bipolar ion with a P-C bond. The product was stable in the form of a bipolar ion in the crystalline state.

"An Image Converter"

Moscow, Otkrytiya, Izobreneniya, Promyshlennyye Obratzsy, Tovarnyye Znaki, No 36, Dec 71, Author's Certificate No 322781, Division G, filed 19 May 70, published 30 Nov 71, p 163

Translation: This Author's Certificate introduces an image converter made in the form of a semiconductor plate to which metal ring electrodes and a central point electrode are applied for a radial field. As a distinguishing feature of the patent, conversion errors which result from rotation and change of image scale are eliminated by using a sawtooth voltage source and by placing an additional electrode on the semiconductor plate inside the ring electrode. This auxiliary electrode is made from a material with conductivity opposite to that of the semiconductor plate and takes the form of one turn of an Archimedes spiral with one end connected to the ring electrode and the other end connected through a load to the source of sawtooth scanning voltage.

"Investigation of a One-Dimensional Solid-State Image Converter"

Moscow, Avtomatika i Telemekhanika, No 1, Jan 72, pp 189-191

Abstract: The article is a description of a solid-state one-dimensional image converter which utilizes the inverse Hall effect (the Suhl effect). The main scanning element is a rectangular semiconductor plate with one light-sensitive face and a point contact or PN-junction for signal takeoff on the opposite face. An attracting electric field is applied lengthwise of the scanning element. The plate is placed in a magnetic field whose strength is a linear function of time. When an image is projected on the light-sensitive surface, nonequilibrium carriers are generated in accordance with the intensity of the emission on the surface. These carriers are subjected to Lorentz force, Hall force, and the force of the

VINOGRADOVA, Ye. P., ZOTOV, V. D., Avtomatika i Telemekhanika, No 1, Jan 72, pp 189-191

electric field. This results in redistribution of the carriers in the bulk of the semiconductor. Current takeoff affects the minority carriers corresponding to sequential sections of the surface as the magnetic field strength increases. If the laws of redistribution of the minority carriers are known, this process can be controlled and optimum parameters of the device can be selected depending on the job to be done. Preliminary calculations show that a resolution of the order of 30 lines/mm and a line conversion time of the order of a few microseconds can be achieved with a main scanning element about 30 microns in width with a light sensing surface approximately 10 mm long when the long dimension of the current takeoff is about 5 microns, and the illumination is approximately 100 lx. "Radiochemical Synthesis of Organophosphorus Compounds Based on Indene and
Phosphorus Trichloride"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 9, Sep 73, pp 2084-2085

Abstract: Gamma irradiation of the mixtures of indene and PCl_3 under con-
ditions favoring either addition of PCl_3 to the double bond or polymerization
as well as under conditions practically excluding the possibility of polymeri-
zation yields, fails to induce the addition of PCl_3 to the indene along the
double bond. This may be due to an extremely unsaturated state of the indene
double bond leading principally to the polymerization products.

"Testing of Some Organophosphorus Compounds and Carbamates against Larvae of
Aedes Mosquitoes (Culicidae) in Experiments with Aerial Spraying"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol 39, No 5,
Sep/Oct 70, pp 599-603

Abstract: The use of organophosphorus compounds and carbamates against
mosquito larvae was tested in the Yakut ASSR, in the area of the villages of
Novy, Aikhal, and Mirny, and the Udachnaya deposits. Water reservoirs were
treated by aerial spraying from an AN-2 plane. The following pesticides were
tested: bytex, methylnitrophos, trolen, sevine, and dipterex; DDT was used as
the reference. Comparatively uniform marshy territories with occasional for-
ests and bushes were selected. Bytex was shown to be especially effective as
a larvicide, a dose of 40 g/hectare proving to be sufficient. Methylnitrophos

KRIVTSOVA, Ye. N., et al., Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol 39, No 5, Sep/Oct 70, pp 599-603

required a 100 g/hectare dose to be effective; trolen in doses 40 and 80 g/hectare reduced the density of mosquito larvae only insignificantly. Dipterex and sevin proved ineffective as larvicides, being significantly inferior to DDT. The effect of mosquito larvae eradication with organophosphorus compounds lasts for 7-14 days.

"Influence of γ -Radiation on the Physical Mechanical Properties of Polyethylene and Polycarbonate"

Moscow, Plasticheskiye Massy, 7, 1973, pp 10-12

Abstract: A study was made of the influence of γ -radiation on the molecular structure of high density polyethylene (HDPE) and polycarbonate (PC). Increasing the dose to 25 millirads resulted in an increase in the stability limit during stretching for HDPE; increasing the dose from 25 to 200 millirads resulted in a decrease in σ_v . Density, module of elasticity, hardness, and fatigue stability for HDPE in general increased with increasing dose. The molecular weight and fatigue resistance decreased for PC. Values for other parameters are given. The radiation of HDPE results in "linking" processes and leads to the breakdown of spherulite formation, and to the breakup and subsequent compaction of the structural elements. In PC, however, irradiation results in destructive processes leading to the fragmentation of the polymers.
